Towards zero emission shipping - Simulating and assessing energy grids for Europe's next generation of ships

Final Conference of the EU research project JOULES

Reducing harmful emissions from shipping is a technical challenge as well as an urgent political and societal issue. For the last four years, the research project JOULES has been developing assessment and simulation tools to analyse ships' energy grids, and applied them for a variety of ship designs and operation scenarios. The final conference is intended to present project results and to discuss possible ways towards their implementation.
